

If your **CHILD** has
MIGRAINES,
discover the **ROAR** study

A clinical research study for children ages 6–11

Migraine headaches are painful and disruptive, and they affect people of all ages.

The ROAR clinical research study will test how effective and safe a study drug is in children with migraine headaches. The study drug is approved by the U.S. Food and Drug Administration for migraine prevention in patients 12 years old and older, but not for children younger than 12.

Your child might be able to be in this study if he or she is 6-11 years old and:

- Weighs at least 17 kg (about 37 pounds) and not more than 50 kg (about 110 pounds).
- Has had migraine headaches for at least six months.

Additional requirements apply.

The study drug and all study-related tests will be provided at no cost. You may receive reimbursement for study-related expenses, such as travel and parking.
